HOW TO REPLY TO THIS NOTICE:

I. Review the SMALL ENTITY status shown above.

If the SMALL ENTITY is shown as YES, verify your current SMALL ENTITY status:

A. If the status is the same, pay the TOTAL FEE(S) DUE shown above.

B. If the status above is to be removed, check box 5b on Part B - Fee(s) Transmittal and pay the PUBLICATION FEE (if required) and twice the amount of the ISSUE FEE shown above, or

EXAMINER'S AMENDMENT

Continued Examination Under 37 CFR 1.114

1. A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after allowance or after an Office action under *Ex Parte Quayle*, 25 USPQ 74, 453 O.G. 213 (Comm'r Pat. 1935). Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, prosecution in this application has been reopened pursuant to 37 CFR 1.114. Applicant's submission filed on 08-13-2010 has been entered.
2. An examiner's amendment to the record appears below. Should the changes and/or additions be unacceptable to applicant, an amendment may be filed as provided by 37 CFR 1.312. To ensure consideration of such an amendment, it **MUST** be submitted no later than the payment of the issue fee.
3. Authorization for this examiner's amendment was given in a telephone interview with Ronald Santucci on May 4th, 2010.
4. The application has been amended as follows:
 - a. In the claims, **claims 1-25** have been cancelled.
 - b. In the abstract, The abstract has been amended to now read:

The invention relates to a coating comprising a getter metal alloy and to an arrangement and method for the production thereof. The coating therein consists of a ~~non-vaporising~~ non-vaporizing getter metal alloy (2) for an inner wall (3) of a high-vacuum vessel (4). ~~The getter metal alloy coating (1) therein is not encumbered with noble gas inclusions and comprises a metal alloy deposition product from a noble gas free getter metal alloy plasma 6.~~ The arrangement basically consists of a metal plasma generator (7), which in turn comprises an insulator member (8),

which carries an ignition electrode (9) and a cathode wire (10) comprising a getter metal alloy (2). Those three components are surrounded by a cage-like anode member (13), which together with the insulation member (8) projects into the high vacuum vessel (5) to be coated and is supplied with cathode potential (12), high-voltage ignition pulse (19) and anode potential (14) by a voltage supply device (16), the anode member (13) together with the high-vacuum vessel (4) being held at ground potential. ~~Preference is given to the coating, by means of that arrangement, of high-vacuum vessels (5) of beam guidance tubes of an ion beam acceleration system in order to produce ultra-high vacuums therein.~~

5. The following is an examiner's statement of reasons for allowance:

As discussed in the previous office action, Benvenuti (US 6468043) in view of Welty (US 5269898) in view of Snaper (US 3625848) renders it obvious to use a cathodic arc discharge method with a cage shaped anode surrounding the cathode in order to deposit the claimed gettering metal alloys on an inner wall of a high-vacuum vessel to be coated while the metal plasma arc rotates about the cathode. However, none of these references teach using a cathode wire which has been wound onto an insulator rod, instead, as taught in Welty, they teach a rod-like cathode (col 3, lines 63-65).

Johnson et al teaches generating a plasma arc using a cathode which has been wrapped around an insulating rod and surrounded by a cage shaped anode in order to reduce instabilities in a plasma arc. However, Johnson et al is not creating an arc between the cathodic conductor **28** and the cage shaped anodic conductor **32**, but rather creating a plasma arc with a single helix profile that follows the shape of the cathodic conductor **28** on the insulating rod between the cathode **26** and anode **30** (col 4, lines 18-30). In other words, Johnson et al teaches making a plasma arc in

the shape of a spiral around the axis of the insulating rod. By contrast, Welty teaches a (relatively straight) arc between the cage shaped anode and the rod shaped cathode, so it is perpendicular to the axis of the insulating rod. Thus, the produced arc of Johnson et al is shaped very differently and is normal to the arc of Welty et al. The arc of Johnson et al is operating in a different manner than Welty et al. Thus, there is no expectation that the specific instabilities found in the arc of Johnson et al would be present in Welty et al or that the use of a helical cathode would then solve those problems. Thus, there is no motivation to apply the solution of Johnson et al to the process of Benvenuti in view of Welty in view of Snaper. Furthermore, since Johnson et al is not directed to a cathodic arc deposition method, but rather to a method of igniting explosives, Johnson cannot be used to teach that the use of a cathode wound around an insulating rod was known to cathodic arc deposition methods or that it would produce predictable results.

6. Thus the art of record does not fairly teach or suggest using a cathode wire which has been wound onto an insulator rod in a cathodic arc discharge method with a cage shaped anode.
7. Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
